Résumé — Back-end / Full Stack Developer

Leonardo Noria

Back-end Software Engineer · Go · Python · Microservices · Full Stack

Belo Horizonte, MG, Brazil · leonoria09@gmail.com · +55 (31) 99853-1810 · linkedin.com/in/leonardonoria · github.com/norialeo

Summary

Software engineer focused on the back-end, currently working on two products in production. At LITS, I build Go microservices with gRPC, PostgreSQL and Kubernetes for a social app with PIX and card payments. At Exxata, I develop Python/FastAPI APIs and real-time computer vision for a multi-tenant industrial platform.

I deliver features end to end, from the database to the app, with an emphasis on data integrity, security and testing. In code review, I found and fixed bugs that would have broken every paid booking confirmation and generated wrongful PIX charges.

Technical skills

- **Languages:** Go, Python, Dart, JavaScript, SQL, HTML/CSS · Java (studying)
- **Back-end:** microservices, gRPC (Connect-Go), Protobuf, REST/OpenAPI (Fiber v3, Huma v2), FastAPI, SQLAlchemy, JWT, BFF, transactional outbox
- **Data:** PostgreSQL (pgx v5, SQL without ORM), versioned migrations with Atlas, SQLite, Supabase, per-column least-privilege permissions
- **Infra & DevOps:** Kubernetes (GKE), ArgoCD/GitOps, GitHub Actions, Docker/Compose, Nginx, Linux, image signing and attestation (cosign/KMS), NVIDIA GPU servers
- **AI & computer vision:** YOLO/Ultralytics, PyTorch, OpenCV, SAM 2, PaddleOCR, FFmpeg/RTSP, multi-object tracking, Roboflow
- **Front-end & mobile:** Flutter (Riverpod, go_router), Vue 3 (Pinia, Vue Router), Chart.js, Three.js, i18n, mobile accessibility
- **Integrations:** Mercado Pago (PIX and card), Firebase Auth, Mapbox, Amplitude, Inngage CRM, FindFace Multi, IoT (ESP32/LiDAR)
- **Practices:** PR code review, acceptance-criteria-driven testing, GitOps, technical documentation, Linear

Professional experience

LITS — Full Stack Developer (back-end focus)

Sep 2026 – present · Remote

Social tennis app with court booking at partner clubs, open games on a map, communities, chat, rankings and split payments between players via PIX and card. Lean team, milestone-based delivery, issues in Linear, PR code review and versioned deploys through an integration branch.

- **Prevented a production payments failure:** an analytics event emitted in the same transaction as the booking confirmation, outside an allowlist, would have made every paid booking confirmation fail. Fixed it with a migration and an adjustment to the ledger's deploy ceiling.
- **Eliminated a wrongful PIX charge:** traced across microservices a cancelled-game re-offer flow that opened a charge for another player, reverted the behavior and covered the case with a test.
- **Delivered end-to-end features** (Protobuf, Go microservice, migration, BFF and Flutter app): "near me" community search with distance calculation, game cancellation reasons, server-generated analytics events and a redesigned game-creation flow.
- **Least-privilege database security:** migrations with per-column permissions for each service, post-conditions that validate the final permission state inside the migration itself, and tests for grant accumulation across migrations.
- **Production pipeline integrity:** maintained the migrations ledger (atlas.sum) and the attestation pins of signed images (cosign/KMS), ensuring only reviewed migrations reach the production database.
- **Reliable product data:** events published to Amplitude and the CRM (Inngage) through the transactional outbox pattern.
- **Quality:** acceptance-criteria-driven tests with "proof by sabotage" (I break the behavior on purpose and confirm the test catches it) and widget tests with the real brand fonts to validate the layout pixel by pixel against the prototype.
- **Faithful, accessible mobile UI:** Flutter screens built from the prototype (light/dark theme, pt/en/es i18n), with screen-reader support, 48dp touch targets, large text and reduced motion.

Stack: Go · Connect-Go/gRPC · Protobuf · Fiber v3 · Huma v2 (OpenAPI) · PostgreSQL · pgx v5 · Atlas · Kubernetes (GKE) · ArgoCD · GitHub Actions · Flutter/Dart · Riverpod · Firebase Auth · Mapbox · Mercado Pago · Amplitude

Exxata Engenharia — Full Stack & Computer Vision Developer

Aug 2026 – present · On-site

OPTIKON: a multi-tenant platform for intelligent camera monitoring of construction sites and industrial operations, with real-time computer vision, face and vehicle recognition, OCR, IoT sensors and productivity and safety dashboards. It currently runs 41 cameras in the field, spread across several client companies.

- **Python REST APIs:** FastAPI, SQLAlchemy and PostgreSQL in a distributed architecture, with a central database, local databases per processing server and data and video-stream routing between servers.
- **Multi-tenant access control with JWT:** global admin, per-company managers and per-page and per-camera restrictions, enforced on both back-end and front-end.
- **FindFace Multi integration** (face and vehicle recognition): on-demand pagination, temporal event deduplication, token renewal and per-company camera filtering.
- **AI in production:** shipped a YOLO person-segmentation model to client cameras and designed a pipeline that classifies worker productivity, replacing a manual process.
- **Computer vision pipelines:** real-time inference (RTSP via FFmpeg, multi-object tracking, an alert rules engine, OCR with PaddleOCR) and semi-automatic dataset pre-labeling with YOLO, SAM 2 and Roboflow.
- **Operations and documentation:** Docker Compose and Nginx on Linux GPU servers; brought a production AI service back by fixing an NVIDIA driver incompatibility (DKMS). Wrote the system's complete technical documentation.

- **Front-end and IoT:** Vue 3 SPA with Chart.js dashboards (alerts, camera availability, CPU/RAM/GPU) and a Three.js 3D view built from binary ESP32 LiDAR readings.

Stack: Python · FastAPI · SQLAlchemy · PostgreSQL · SQLite · Supabase · Vue 3 · Pinia · Chart.js · Three.js · YOLO/Ultralytics · PyTorch · OpenCV · SAM 2 · PaddleOCR · FFmpeg · Docker · Nginx · Linux

Education

- B.Sc. in Software Engineering — PUC Minas · in progress, expected graduation in 2029

Languages

- Portuguese — native
- English — upper intermediate
